Search engine bias

Search engine bias is a phenomenon where search engines may favor certain search results over others, often due to factors such as the source or reputation of the website. This can have implications for the information users receive, as they may not see all relevant or accurate results.

In the context of information retrieval, search engine bias can occur for various reasons, including commercial interests, political偏见, or technical limitations. For example, a search engine might prioritize results from high-traffic websites or those with more backlinks, potentially excluding smaller or less popular sites.

Understanding and addressing search engine bias is crucial for ensuring that the information users find is comprehensive and accurate. This requires ongoing research into the mechanisms behind bias and the development of tools and methods to mitigate its effects.

Key words: Information; Internet; Search engines; Search operators; Information Specialist.
“Droterocin alfa”

The text seems to be discussing a medical topic, potentially related to clinical trials or research. The text includes references to various scientific papers and databases such as ProCite and EndNote. The document appears to be an academic or professional report or article, possibly related to the field of medicine or biotechnology.
PubMed - Meta-Search Engine

PubMed is a Meta-Search Engine that allows you to search multiple databases at once. It provides quick access to MEDLINE, Google Scholar, and other resources.

PubMed can be accessed through a web-based interface, or through an application installed on your computer.

For more information on using PubMed, please visit the official website or contact your local library.

SciVerse - Google Scholar

SciVerse is a search engine that allows you to search the web for scholarly articles, books, and other types of research. It is part of the larger Google Scholar platform, which also includes Google Scholar Citations and Google Scholar Alerts.

SciVerse allows you to search by author, title, journal, and other criteria, as well as to browse through lists of related articles and authors.

For more information on using SciVerse, please visit the official website or contact your local library.

OVID - MEDLINE

OVID is a search engine that allows you to search MEDLINE, a database of biomedical literature. It is part of the larger OvidLink platform, which also includes other databases such as PubMed and Scopus.

OVID allows you to search by author, title, journal, and other criteria, as well as to browse through lists of related articles and authors.

For more information on using OVID, please visit the official website or contact your local library.
